

Solution to infinite regress:

When you see the solution, you see how everything began.

The dual torus expands and contracts simultaneously, so the net expansion is zero.

Therefore, there is no space (expansion) and thus there cannot be a chain of causes, finite or infinite.

We have now solved infinite regress.

But the universe is here, so how does space come about? That is, how does this zero create space anyway?

The dual torus might be what consciousness is (i.e., a feedback loop), so now you start with a primordial consciousness. This consciousness through feedback can eventually evolve into everything we see.

But doesn't that reintroduce infinite regress? You stopped physical regress by having no real space, but now you reintroduced infinite regress by having this "mental space" instead.

Well, no. If you do the math, infinite regress means causes that go back infinitely. If you start with a primordial consciousness, you can build the world from there. So, in a sense, the primordial consciousness is the Unmoved Mover.

The Unmoved Mover is a thing that doesn't move but causes something else to move. The dual torus spins but it doesn't move: it stays zero.

But now the spin itself contains infinite regress, because how did it start?

My solution here was that the spin spins so fast it is timeless and therefore doesn't need to start because if you have no time, you cannot start anyway. Thus, this spin doesn't go from A to B. In the dual torus, A is B. The expansion = contraction. You don't start with the expansion and then get the contraction. You start with both simultaneously!!! So, what is going on here is that the dual torus is a paradox seen with animal eyes. We are basically looking at a timeless thing through the lens of time, which will distort the image.

So, when you look at the dual torus the right way, it does solve infinite regress for real.

But how come it exists?

Here I tried to define nonexistence and found that I couldn't do it without ending up with a nonsensical definition. I define nonexistence as the absence of everything. But if we remove everything, we also remove absence because absence is linked to presence, which is included in

everything. So, by removing everything, you also remove absence and then your definition becomes: the ? of everything (i.e., presence, absence, all space and time, etc.).

Is existence a brute fact then? No.

Here I dug even deeper and found that:

There must be a real reason why existence is. A deeper reason. And I found one thing that can do something quite remarkable: Balance. Balance can be its own creator. Its doing is its being and its reason and justification. All in one package. It is the only “child in God’s kingdom” that can be both the “chicken and the egg” at the same time. If you ask: Why does balance exist? It exists to balance. Why does it balance? Because it must balance. Why must it balance? To balance. It ends the infinite regress right there because you always get “balance” back as an answer. The why-questions stop here. You can’t move beyond it! This is the final stop. And what happens if you disrupt the balance? You get balance again. And what if you removed balance? You would get a state where infinite regress isn’t resolved, so once again you need balance! Balance is really the final key to understand why existence is here, how it is here, what it is doing, what the end goal is; the meaning of life, why life etc etc. In short: My answer to the meaning of life question is: balance. But what does that really mean? I don’t ultimately know.

But if you removed balance and everything, you literally have nothing to build infinite regress with, so why does balance exists then if having balance solves the regress and not having it also solves the regress?

Balance/the dual torus makes timelessness via motion. So, it is motionlessness and contains all motion inside it. Thus, if you remove both motionlessness and motion (i.e., everything), you seem to end up with a paradox instead of “nothing”. First of all, you cannot define nothing and also make sense. But even if we pretend that you can, it is not clear to me whether you get a paradox, “nothing” or something else. Remove motion and you get motionlessness. Remove motionlessness and you get motion. Remove both at the same time, and you end up with both. Then fuse motionlessness and motion together and then remove them/it, and you get “nothing” or, do you get a paradox or nonsense? It is hard to tell because at the end of the day, you cannot define “nothing”, so it is like playing a game of chess but you are playing with a piece (nothing) that has no clear role, so what happens when you play a game is anybody’s guess.

No, I think that, if you mull hard enough on the topic of balance, you will clearly see why it must be. Existence is not a brute fact. Existence is because balance (i.e., the cuboctahedron/dual torus) is self-explanatory. That is, it can sustain itself forever and do so without any paradox (i.e., infinite regress). But still, there’s an even deeper reason here that is hard to put into words. But I tried to do it above. What I mean is, if you ask “why” something must be and etc, then you get

an answer back, and then you say: “Why”? And you go back like that seemingly forever. But with balance, you always get “balance” back as an answer, so the “whys” stop. And in that moment, you understand! This is the final answer because there is literally nothing beyond it (which you can see geometrically in the cuboctahedron as well).

So, again, balance is my final answer too.

How did everything begin?

With balance.
